# EXP NO : 5. Average Fuel Efficiency and Percentage Improvement Using NumPy

Aim: To calculate the average fuel efficiency and percentage improvement between two car models using NumPy.

Algorithm:

1. Import NumPy.
2. Create an array of fuel efficiencies.
3. Calculate the average using np.mean().
4. Calculate the percentage improvement between two car models.
5. Display the results.

Program:

```
import numpy as np

fuel_efficiency = np.array([20, 25, 30, 35])

average = np.mean(fuel_efficiency)

car1 = 20
car2 = 30

improvement = ((car2 - car1) / car1) * 100

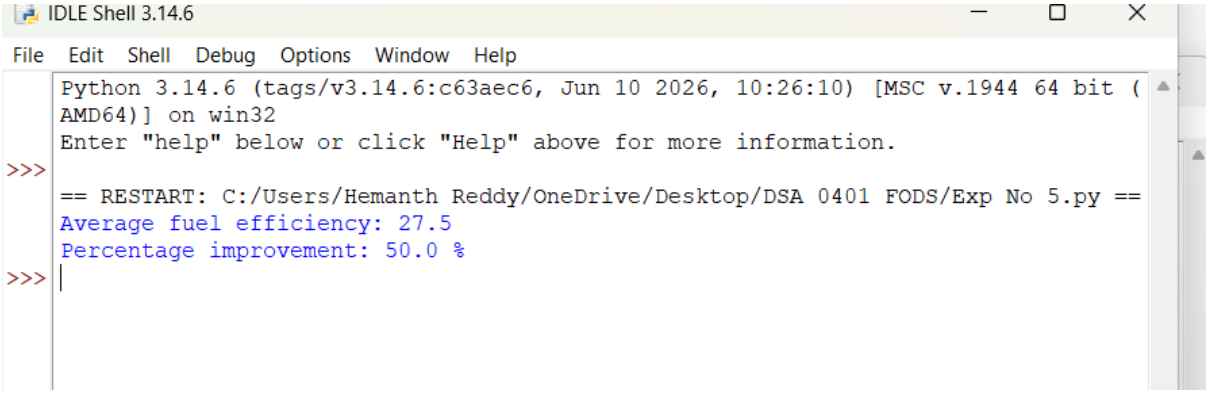

print("Average fuel efficiency:", average)
```

print("Percentage improvement:", improvement, "%")

Output:

Average fuel efficiency: 27.5

Percentage improvement: 50.0 %

Result: The average fuel efficiency is 27.5 mpg, and the percentage improvement is 50%.
